## RESEARCH INTERESTS

---

### Interactive and Interpretable Generation via Uncertainty Quantification

In real-world applications, Large Language Models (LLMs) are often used in collaborative, interactive settings where multiple agents or users work toward a shared goal. Rather than providing all the necessary information up front, these situations often require agents to ask follow-up questions and gauge how confident they are in their predictions. A key challenge is to understand and guide this back-and-forth process in an efficient and reliable manner. My research aims to develop novel and practical algorithms grounded in methods and principles from uncertainty quantification such as Information Gain and Conformal Inference, further pushing the frontier of high-stake, sensitive and important applications like Medical Question Answering and Personalized Recommendations.

### Parsimonious Representation Learning and Engineering

A fundamental building block of successful deep learning models lies in having effective and meaningful representations. However, it remains a mystery what information they contain and how they emerge. Recent theories suggest parsimonious representations, such as sparse and low-rank representations, emerge naturally from training highly over-parameterized models from large amounts of data. Leveraging classical signal processing, statistics and optimization, my goal is to bridge existing theories with the new, emergent and powerful generative models to characterize such emergent phenomena. By finding structured data and model assumptions, my work can foster holistic understanding and enable principly-guided applications in Model Editing, LLM Detoxification, Information Retrieval, and Retrieval-Augmented Visual Generation.

### Practical ML Applications with Real-world Constraints

Safety-critical ML applications in real-world settings such as healthcare and finance often fall short due to their idealized and unrealistic constraints. Assumptions such as financial cost, population bias, measurement errors and data completeness are often violated or ignored, casting doubts for reliable and trustworthy applications. Currently, my research focuses on the proper implementation with emphasis on interpretability and controllability. For tasks such as cancer metastasis prediction, I join forces with domain experts and oncologists to ensure intuitive Human-AI collaboration that foster trust between clinicians and users in clinical settings. More broadly, careful designs are equally important to a wide range of problems such as Health Exercise Recommendation, Failure Prediction, and Medical Resource Allocations.

## EDUCATION

---

### University of Pennsylvania

Expected: 2027

Doctor of Philosophy in Electrical and Systems Engineering

- Awards: Penn Engineering Dean's Fellowship (2023), National Science Foundation Graduate Research Fellow (2021)
- Advisor: Dr. René Vidal

### University of California, Berkeley

2019

Bachelor of Arts in Applied Mathematics

## PROJECT SUMMARIES

---

### Interactively Guiding Large Language Models

05/2024-Current

- Proposed framework for driving LLM decisions-making with sequential human inputs in a collaborative manner and providing correctness-guarantees over LLM's intermediate predictions.
- Developed techniques that bridge between theoretical techniques with practical applications, ranging from classical information theory and predictive inference to modern practical applications of multi-modal and multi-agent AI systems.
- Applied to practical use-cases such as interactive medical diagnosis between human patients and AI doctors.

### Scalable and Collaborative Concept-based Recommendation System

05/2024 - 09/2024

- Proposed a scalable and editable recommendation system that leverages Large Language Models to extract interpretable and representative concepts for large-scale collaborative filtering and recommendations.
- Out-performed thorough comparisons with ID-based recommendation systems and zero-shot Large Language Models

### Controllable Multi-modal Generation and Detoxification of Large Language Models

01/2024 - 05/2024

- Collaborated on a framework for controlling LLM generations via Representation Engineering, Retrieval-augmented Generation and Sparse Decompositions using human-interpretable concepts.

- Released two open-source datasets involving representations of concepts in LLM activation space in LLMs.
- Performed evaluation of question-answering and trustworthy benchmarks on Foundational Models such as multi-modal generative models (StableDiffusion) and Vision-Language Models (GPT-4, LLaVA).
- Co-authored two works, titled “PaCE: Parsimonious Concept Engineering for Large Language Models” [NeurIPS’24] and “Knowledge Pursuit Prompting for Zero-Shot Multi-modal Synthesis” [ECCV’24 workshop].

### Interpretable-by-Design Image Classification via Sequential Predictions

02/2022 - 11/2023

- Proposed an interpretable image classification method for large-scale visual datasets with variable-length and open-ended sets of concepts using Large Language Models (GPT-3, LLaMA) and Visual Language models (LLaVA).
- Conducted human evaluations on the faithfulness of the concept answering model with over 10k image-concept pairs.
- Published as first author titled “Bootstrapping Variational Information Pursuit with Foundation Models for Interpretable Image Classification” [ICLR’24] and co-authored “Variational Information Pursuit for Interpretable Predictions” [ICLR’23].

### Low-dimensional Representations from High-dimensional Data

11/2019 - 10/2022

- A novel unifying framework inspired by compression and rate-distortion theory with theoretical and empirical guarantees that learns geometrically and statistically meaningful and interpretable representations
- Published two works as first author, titled “ReduNet: A White-box Deep Network from the Principle of Maximizing Rate Reduction” [JMLR’21] and “Learning Diverse and Discriminative Representations via the Principle of Maximal Coding Rate Reduction” [NeurIPS’20]

## SKILLS

---

**ML/AI Frameworks:** PyTorch, Tensorflow, Keras, MXNet, Sklearn  
**Data Analysis:** Jupyter Notebooks, NumPy, SciPy, Pandas, Matplotlib, OpenCV  
**Cloud Services:** Amazon Web Services (AWS), Google Cloud Product (GCP)  
**Generative Models:** HuggingFace, OpenAI, Claude  
**GPU Computing:** CUDA  
**Web Development:** Wordpress, HTML  
**Others:** Git, AWS, GCP, Microsoft Office  
**Developing Tools:** Git, Vim, VSCode  
**Scripting:** Bash, Shell  
**Operating Systems:** Windows, Ubuntu, macOS  
**Office:** Microsoft Word, Excel, Powerpoint  
**Fluent Languages:** English, Chinese (Mandarin and Cantonese)
